Graph Transformations - **Solutions** - 2013-2019

Marks are indicated in brackets after each question number

2013 Paper 1 Question 4, (2)

The graph of this function has an amplitude of 4, a period of 180°, and is shifted down by 1 unit.

So, the solution is A.

2013 Paper 1 Question 11, (2)

$y = -f(x-k)$

Compared to the graph of $y = f(x)$ this graph is inverted and shifted 'k' units to the right

By inspection B is the correct solution

2014 Paper 1 Question 11, (2)

The co-ordinates given on $f(x)$ are $(2, 3)$ $(5, 0)$

Consider transforming these using $y = 2f(x) + 1$

This transformation tells us to multiply the y co-ordinate by 2 and add 1

So, $(2, 3)$ becomes $(2, 7)$

And $(5, 0)$ becomes $(5, 1)$

By inspection graph C has these points present

2015 Paper 1 Question 4, (3)

The amplitude is 3 so $p = 3$

The period is 180° so $q = 2$

The graph has been shifted up by '1' unit after p has been applied, so $r = 1$

2015 Paper 1 Question 13, (1) (1) (3) (2)

a) $f(x) = 2^x + 3$

Substitute $x = 1$ to give

$f(1) = 2^1 + 3 = 5$

So, $b = 5$

b) i) The graph would be mirrored in the $45°$ line $y = x$ with all of the x and y co-ordinates swapped.

ii) The image of $P = (5, 1)$

The co-ordinate of $Q = (0, 4)$ so the image of $Q = (4, 0)$

c) $y = 4 - f(x + 1)$

$= - f(x + 1) + 4$

The x co-ordinate of the image of R is 2

The y co-ordinate of the image of R is $-11 + 4 = -7$

So, the co-ordinates of the image of R = $(2, -7)$

2016 Paper 1 Question 15, (3) (1)

a) $f(x) = k(x - a)(x - b)^2$

By inspection of the roots we have

$f(x) = k(x - 4)(x + 5)^2$

Substituting the point (1, 9) gives

$9 = k(1 - 4)(1 + 5)^2$

Rearranging and solving for k gives

$k = -\dfrac{1}{12}$

b) $g(x) = f(x) - d$

Since d is positive the graph of $g(x)$ is the graph of $f(x)$ moved down by $'d'$ units

By considering the graph of $f(x)$ it must be moved down by at least 9 units to give only one root – in other words to move the point (1, 9) below the x axis.

So, $d > 9$

2017 Paper 1 Question 15, (2)

a) The graph of $h(x)$ has been shifted $+5$ units in the x direction and $+3$ units in the y direction.

So, we have $a = -5, b = 3$

b) $\int_6^8 h(x)\,dx = \int_1^3 f(x)\,dx + (2.3)$ [2.3 = the area of the rectangle]

$= 4 + 6 = 10$

c) $f'(1) = 6$ tells us that the gradient of the tangent line at $x = 1$ is 6.

By inspection of the symmetry of the graph of $h(x)$ we have $h'(8) = -f'(1) = -6$

2018 Paper 1 Question 11, (2) (3)

a) $y = 1 - \log_3 x$

$y = -\log_3 x + 1$

The original graph needs to be reflected in the x-axis and moved up 1 unit

b) $1 - \log_3 x = \log_3 x$

$1 = 2\log_3 x$

$\log_3 x = \frac{1}{2}$

$3^{\frac{1}{2}} = x$

$x = \sqrt{x}$

2019 Paper 1 Question 10, (1) (1)

a) $a = 3$

b) $y = kf(x) + a$

Using the points $(2, -1)$ and $\left(2, 5\right)$ for substitution gives

$5 = k(-1) + 3$

$2 = -k$

$k = -2$
